

A Trip to the Bottom of the Sea

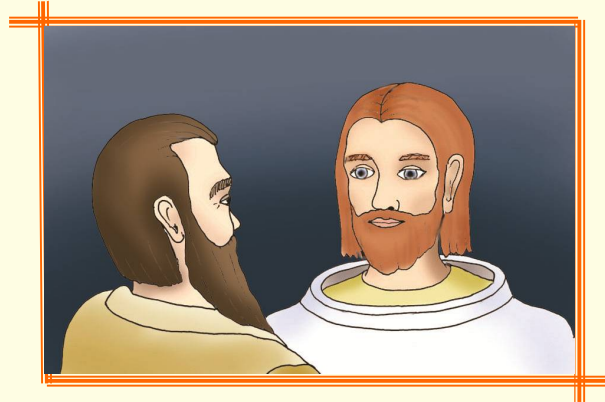

Based on the Plejaren Contact Report 218

1

It was a Saturday night on May 30th 1987 and Billy was in his office. And then suddenly... what a nice surprise! His dear friend Quetzal, who was flying nearby, decided to visit him. Billy asked him if they could fly into space and view the stars and galaxies. Quetzal thought about it and then he had a different idea that was surely going to amaze Billy. Quetzal said that they were going to plunge into the deep sea and observe some of the deep sea creatures there.

Billy was overjoyed about this new plan. He wanted to know whereabouts in the sea they were going to travel to and if the spaceship was suited for diving purposes.

2

Billy and Quetzal

3

Quetzal responded that all of their flying devices were suited for diving processes, whereby, due to their pressure protection screens, there were no limits set for the depth.

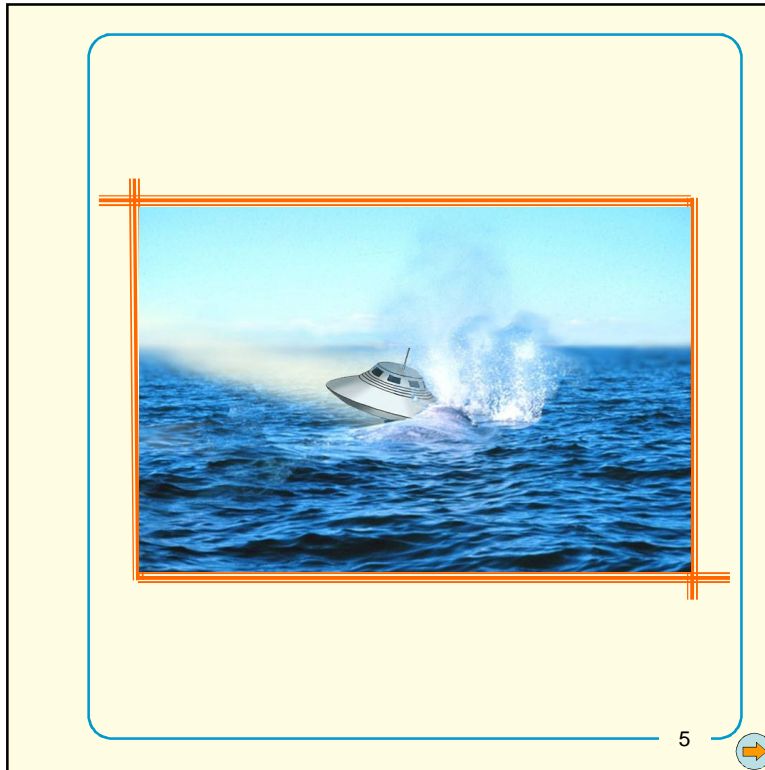

“We will dive into the depths of the Atlantic as well as the Pacific ocean”, Quetzal added.

Then, Billy stepped into the beamship and both of them flew above Earth and over the Atlantic, to then descend into the depths of the sea.

Billy tells the incredible trip in his own words:

“We hover over the spongy sea-bottom and Quetzal moves the beamship, which indeed has now become a diving ship.

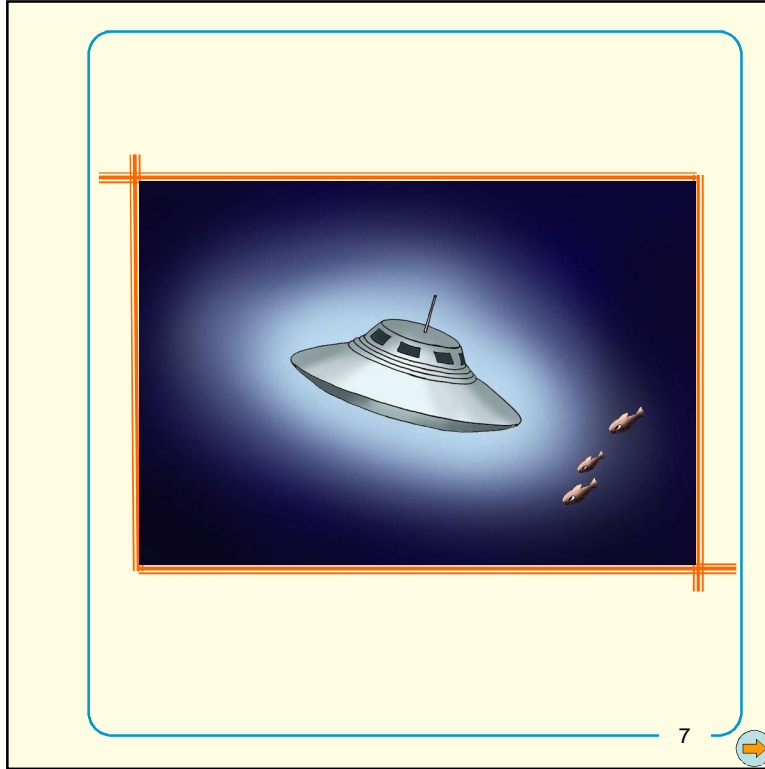

4

The beamship glows externally in radiating brilliance, and lights up the pitch black darkness in a broad circumference.

Not much is said thereby, because I devote my entire attention to everything I can see during one full hour in the deep sea.

In regard to the living things, there is not exactly much to see in the deepest depths, because creatures appear only in isolation, in small form, whereby, for me, however, they are exotic, as are also those in the higher areas of the water.

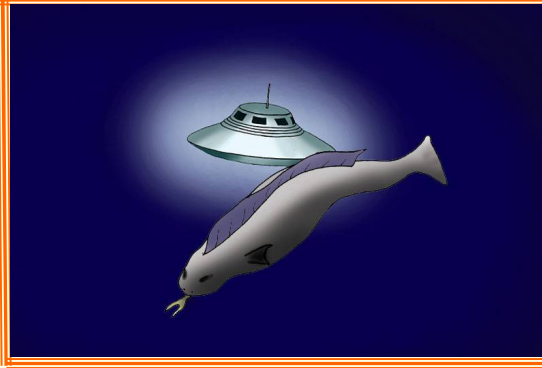

Many of these living things are self-luminous, in greenish or whitish light.

I can only observe bigger life forms extremely sporadically, each and every one of which is of a strange form.

Still more seldom, gigantic animals emerge out of the darkness of the deep sea, as, for example, whitish and reddish as well as brownish giant squid and dark grey or black snake-shaped creatures, which I estimate to be 15 to 20 meters long and four to five meters in diameter.

9

Also, in three different locations, three single gigantic forms of life emerge, which I initially designate as deep sea whales, however Quetzal will instruct me that they are Sleeping Sharks, the existence of which is not yet known to terrestrial humans.

10

The smallest of the three I estimate to be some 10 meters long, while the two others are two to three meters longer.

But there are, among many other very interesting things, also the "black chimneys" (black smokers), of which Quetzal had once spoken, and he said that they are the essential origin of the later forms of life on the Earth, in water, air and land, along with inclusions from outer space through comets, meteors and asteroids.

11

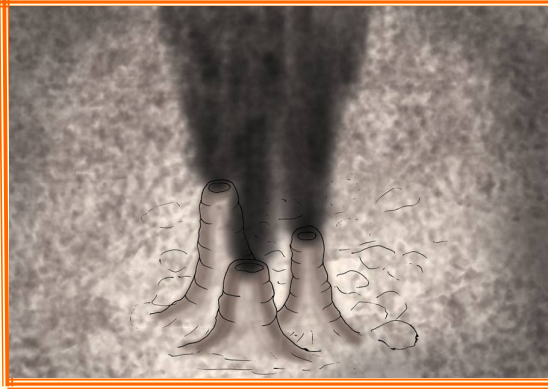

In these "black chimneys" from which pitch black swathes (which are impregnated with sulfur and various materials) rise up, and emerged early branches of bacteria which, as they rose out of the chimneys, were released and began the evolutionary work of life.

But that, says Quetzal, is all still unknown to the terrestrial scientists.

What is still interesting with this observation of the "black chimneys" is the fact that in their nearer and further surroundings, swarms of enormous numbers of large and snow-white creatures, which I simply designate as giant or oversized scampi (shrimp/prawns), bustle about on the sulfurous rocks and steep rocks."

12

Black chimneys

Billy is then returned to his house in the beamship and he was very thankful to Quetzal for such an extraordinary dive to the bottom of the sea.
